3. Our Projects

3.1. Hometime

The Hometime web-based system is an online platform that helps property owners manage their properties and finances. It allows clients to pay expenses through the website, sends reminders to tenants to pay rent, and provides a centralized location for owners to access important property information. The system simplifies the payment process, reduces administrative workloads, and helps to ensure timely payments.

Location: Limassol, Cyprus

Please visit [hometime.com.cy] to visit Hometime.

3.2. Ora

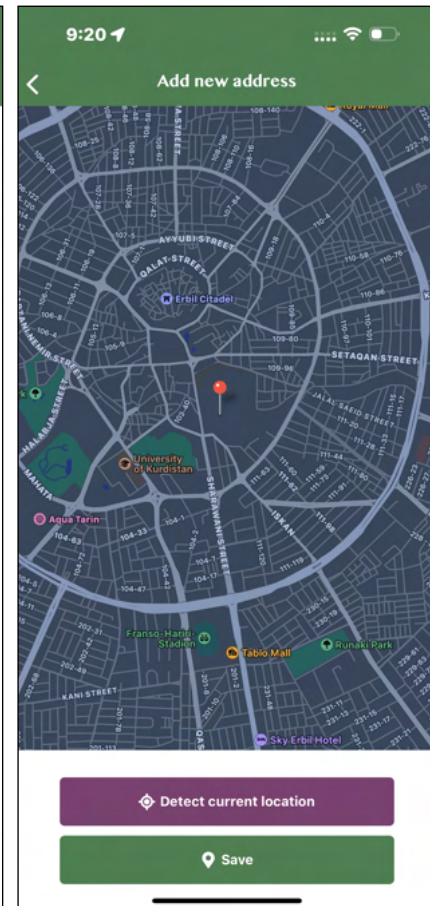

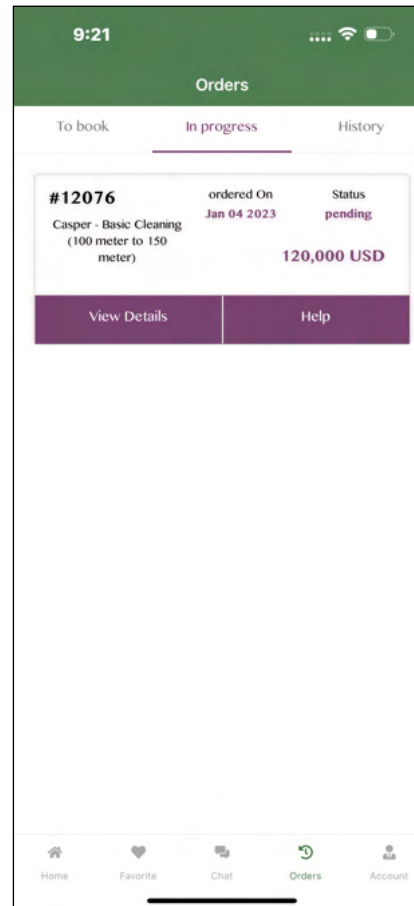

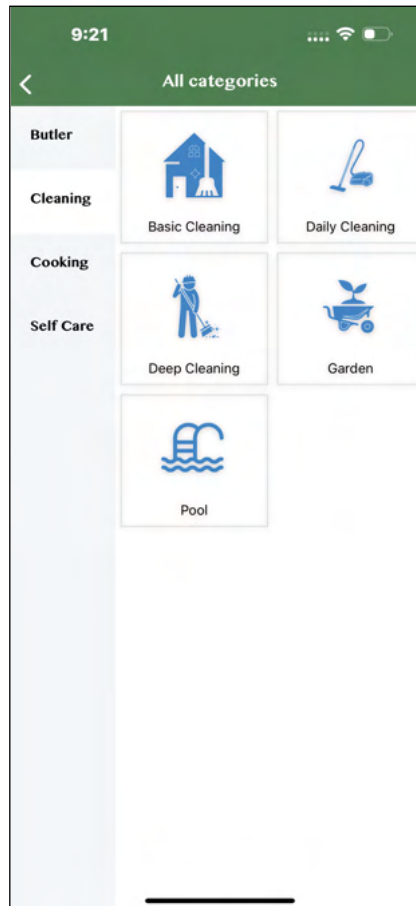

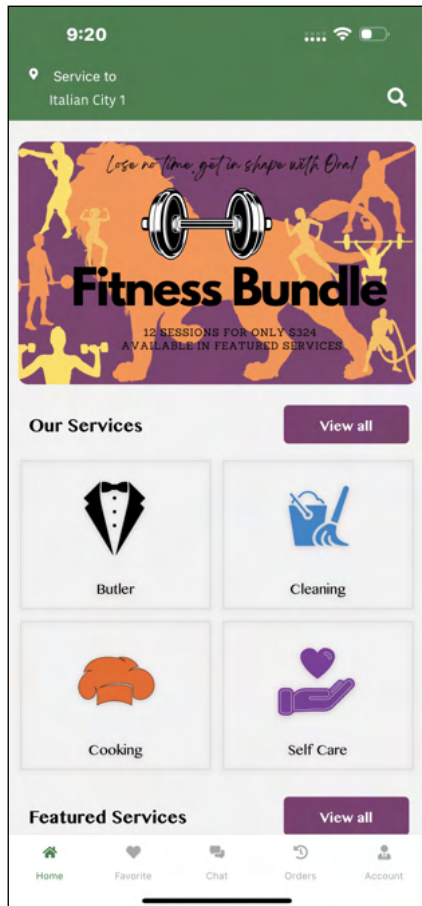

Ora was developed and branded by LJM Net Development in Partnership with Skills House. Ora is an online marketplace which connects consumers with local service providers. The marketplace is accessible through a website, iOS and Android applications. It allows consumers to access services providers where users can rate and review the services that are published by the vendors of Ora. This app has three different types of users: (1) vendors, (2) normal customers, and (3) vendors.

Location: Erbil, Kurdistan, Iraq

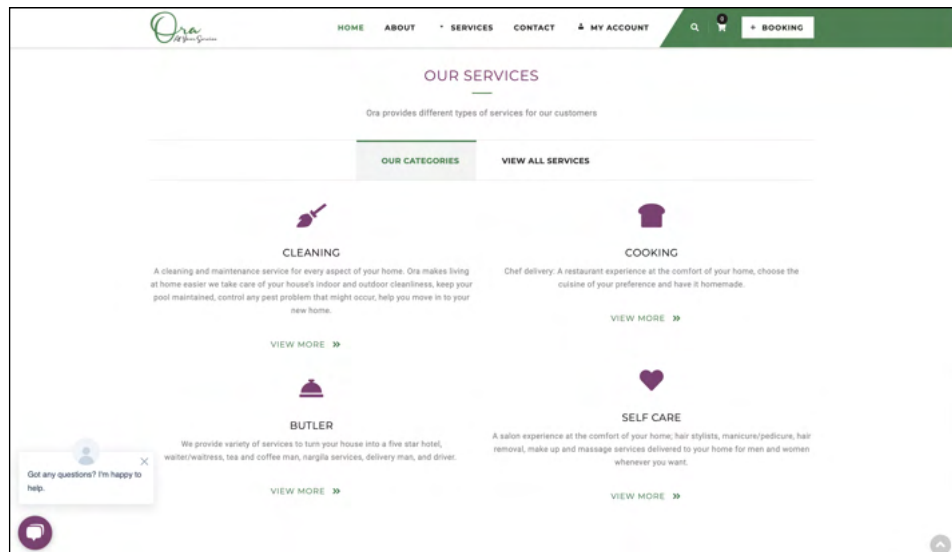

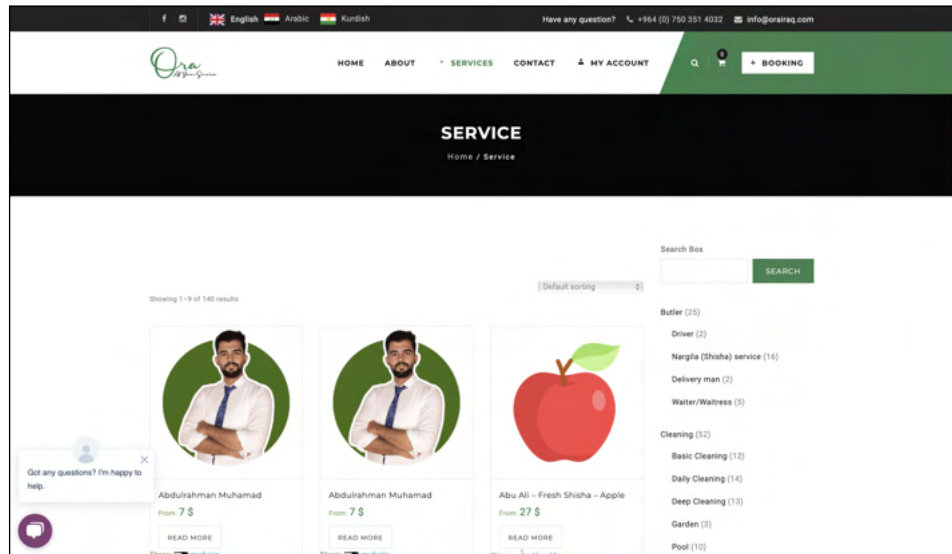

Please visit [orairaq.com] to view Ora's website and search for Ora Iraq on App Store and Play Store.

3.4. Fitness Management

The Fitness Management app is a valuable tool designed for personal trainers to keep track of their clients and schedule training sessions with ease. The app offers a user-friendly interface that allows trainers to organize their clients' information and keep track of their progress. The trainer can schedule sessions with clients and set reminders to ensure that they do not miss any appointments. The app also enables trainers to keep detailed records of all sessions with clients, including the exercises performed, the duration of each session and weight. The app works on both iOS and Android.

Location: Nicosia, Cyprus

3.5. Rental Management

This system was designed by LJM Net Development for Jwani Jeena for real state company. The Rental Management system is an online platform designed to assist property owners in managing their properties and tracking their financials. The user can categorize properties based on various criteria, such as location, complex or size, and track all associated expenses, such as maintenance costs or utility bills. The system generates monthly and yearly reports that show the user's profit and expenses and displays graphs to provide a visual representation of their financial performance. Also, the user can create accounts for their employees with different access to manage their accounts. Laravel and PHP is used to build the system.

Location: Duhok, Kurdistan, Iraq

3.7. Restaurant System

LJM Net Development built a restaurant management system. A Restaurant Management System is a software application that helps restaurants manage their operations more efficiently. This system typically includes features such as inventory management, menu planning, order tracking, and customer management. By automating many of these tasks, restaurant owners and managers can save time, reduce errors, and make more informed decisions about their business. Employees have different access to the system.
